

Practical 7

Aim: To write meta data of your Ecommerce PWA in a Web app manifest file to enable “add to homescreen feature”.

Theory:

Regular Web App

A regular web app is a website that is designed to be accessible on all mobile devices such that the content gets fit as per the device screen. It is designed using a web technology stack (HTML, CSS, JavaScript, Ruby, etc.) and operates via a browser. They offer various native-device features and functionalities. However, it entirely depends on the browser the user is using. In other words, it might be possible that you can access a native-device feature on Chrome but not on Safari or Mozilla Firefox because the browsers are incompatible with that feature.

Progressive Web App

Progressive Web App (PWA) is a regular web app, but some extras enable it to deliver an excellent user experience. It is a perfect blend of desktop and mobile application experience to give both platforms to the end-users.

Difference between PWAs vs. Regular Web Apps:

A Progressive Web is different and better than a Regular Web app with features like:

1. Native Experience

Though a PWA runs on web technologies (HTML, CSS, JavaScript) like a Regular web app, it gives user experience like a native mobile application. It can use most native device features, including push notifications, without relying on the browser or any other entity. It offers a seamless and integrated user experience that it is quite tough for one to differentiate between a PWA and a Native application by considering its look and feel.

2. Ease of Access

Unlike other mobile apps, PWAs do not demand longer download time and make memory space available for installing the applications. The PWAs can be shared and installed by a link, which cuts down the number of steps to install and use. These applications can easily keep an app icon on the user's home screen, making the app easily accessible to the users and helps the brands remain in the users' minds, and improving the chances of interaction.

3. Faster Services

PWAs can cache the data and serve the user with text stylesheets, images, and other web content even before the page loads completely. This lowers the waiting time for the end-users and helps the brands improve the user engagement and retention rate, which eventually adds value to their business.

4. Engaging Approach

As already shared, the PWAs can employ push notifications and other native device features more efficiently. Their interaction does not depend on the browser user uses. This eventually improves the chances of notifying the user regarding your services, offers, and other options related to your brand and keeping them hooked to your brand. In simpler words, PWAs let you maintain the user engagement and retention rate.

5. Updated Real-Time Data Access

Another plus point of PWAs is that these apps get updated on their own. They do not demand the end-users to go to the App Store or other such platforms to download the update and wait until installed.

In this app type, the web app developers can push the live update from the server, which reaches the apps residing on the user's devices automatically. Therefore, it is easier for the mobile app developer to provide the best of the updated functionalities and services to the end-users without forcing them to update their app.

6. Discoverable

PWAs reside in web browsers. This implies higher chances of optimizing them as per the Search Engine Optimization (SEO) criteria and improving the Google rankings like that in websites and other web apps.

7. Lower Development Cost

Progressive web apps can be installed on the user device like a native device, but it does not demand submission on an App Store. This makes it far more cost-effective than native mobile applications while offering the same set of functionalities.

The main features are:

Progressive — They work for every user, regardless of the browser chosen because they are built at the base with progressive improvement principles.

Responsive — They adapt to the various screen sizes: desktop, mobile, tablet, or dimensions that can later become available.

App-like — They behave with the user as if they were native apps, in terms of interaction and navigation.

Updated — Information is always up-to-date thanks to the data update process offered by service workers.

Secure — Exposed over HTTPS protocol to prevent the connection from displaying information or altering the contents.

Searchable — They are identified as “applications” and are indexed by search engines.

Reactivable — Make it easy to reactivate the application thanks to capabilities such as web notifications.

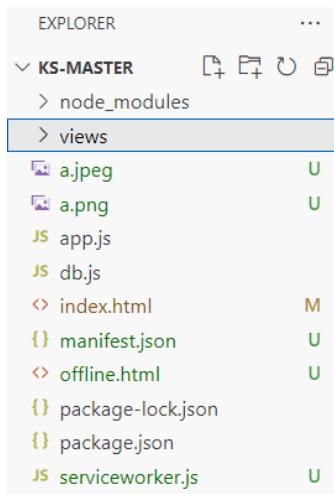

Installable — They allow the user to “save” the apps that he considers most useful with the corresponding icon on the screen of his mobile terminal (home screen) without having to face all the steps and problems related to the use of the app store.

Linkable — Easily shared via URL without complex installations.

Offline — Once more it is about putting the user before everything, avoiding the usual error message in case of weak or no connection. The PWA are based on two particularities: first of all the ‘skeleton’ of the app, which recalls the page structure, even if its contents do not respond and its elements include the header, the page layout, as well as an illustration that signals that the page is loading.

Code and output:

Adding the manifest and serviceworker files:

Inserting the code:

//manifest.json

```
{  
  "name": "KiddoShield",  
  "short_name": "KS",  
  "start_url": "index.html",  
  "display": "standalone",  
  "background_color": "#5900b3",  
  "theme_color": "black",  
  "scope": "./",  
  "description": "This is a PWA tutorial.",  
}
```

//serviceworker.js

```
var staticCacheName = "Kiddoshield";  
  
self.addEventListener("install", function (e) {  
  e.waitUntil(  
    caches.open(staticCacheName).then(function (cache) {  
      return cache.addAll(["/"]);  
    })  
  );
```

```
});

self.addEventListener("fetch", function (event) {
  console.log(event.request.url);

  event.respondWith(
    caches.match(event.request).then(function (response) {
      return response || fetch(event.request);
    })
  );
});
```

//index.html

The header includes:

```
<!-- Meta Tags required for
  Progressive Web App -->
<meta name=
"apple-mobile-web-app-status-bar"
  content="#aa7700">
<meta name="theme-color"
  content="black">

  <!-- Manifest File link -->
<link rel="manifest"
  href="manifest.json">
```

The body includes:

```
<script>
  // Add event listener to execute code when page loads
  window.addEventListener('load', () => {
    // Call registerSW function when page loads
    registerSW();
  });

  // Register the Service Worker
  async function registerSW() {
    // Check if browser supports Service Worker
    if ('serviceWorker' in navigator) {
      try {
        // Register the Service Worker named 'serviceworker.js'
        await navigator.serviceworker.register('serviceworker.js');
      }
      catch (e) {
        // Log error message if registration fails
      }
    }
  }
</script>
```

```

        console.log('SW registration failed');
    }
}
</script>

```

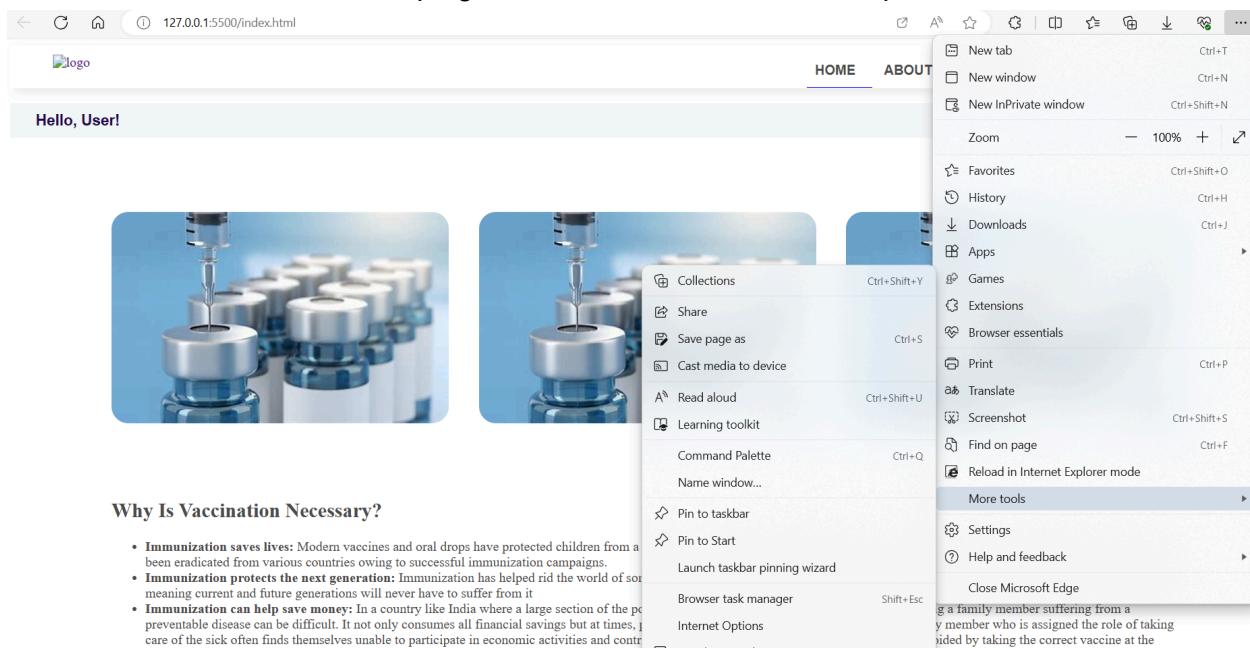

Installing live server:

Click on “Go live” in the bottom right corner:

Click on the three dots on the top right corner-> more tools-> developer tools:

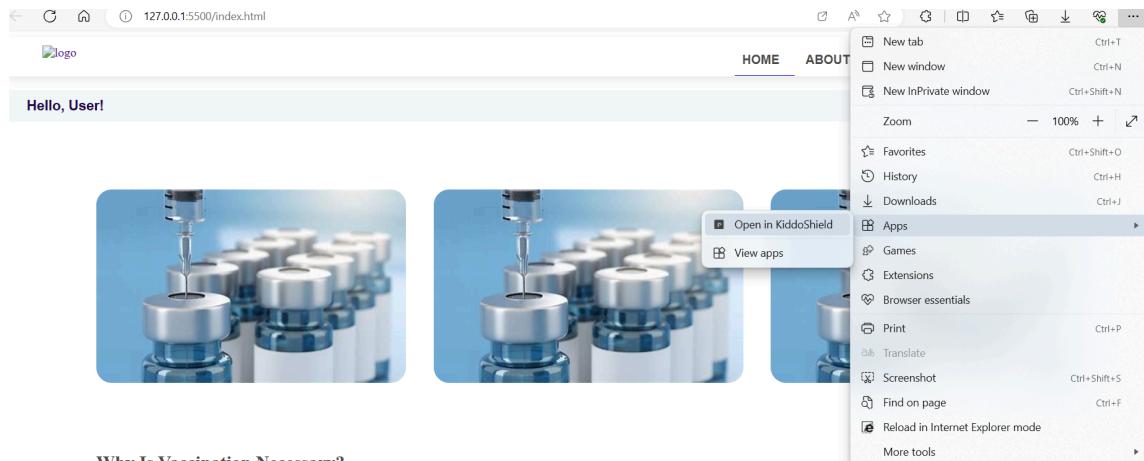

Why Is Vaccination Necessary?

- **Immunization saves lives:** Modern vaccines and oral drops have protected children from a been eradicated from various countries owing to successful immunization campaigns.
- **Immunization protects the next generation:** Immunization has helped rid the world of so meaning current and future generations will never have to suffer from it
- **Immunization can help save money:** In a country like India where a large section of the preventable disease can be difficult. It not only consumes all financial savings but at times, care of the sick often finds themselves unable to participate in economic activities and contr right time

Why Is Vaccination Necessary?

- **Immunization saves lives:** Modern vaccines and oral drops have protected children from a wide variety of dangerous and fatal diseases. In fact, some historically prevalent diseases have now been eradicated from various countries owing to successful immunization campaigns.
- **Immunization protects the next generation:** Immunization has helped rid the world of some very serious debilitating diseases. Polio, for example, means current and future generations will never have to suffer from it.
- **Immunization can help save money:** In a country like India where a large section of the population belongs to minimal income groups, supporting a family member suffering from a preventable disease can be difficult. It not only consumes all financial savings but at times, pushes families towards financial instability. The family member who is assigned the role of taking care of the sick often finds themselves unable to participate in economic activities and contribute to the income of the family. All of this can be avoided by taking the correct vaccine at the right time.

Conclusion:

Thus, the “add to homescreen feature was successfully enabled by adding a manifest file to our web app.
